

Focus Your Analysis

Firstly get the md5 or sha256 and go to virustotal to check it

1. Use floss as a tool instead of strings it makes pch of staff like decrypting and simplifies the things and at bottom section prints the conclusion
2. Always use .malz extension after .exe to disarm the malware
3. Start basic static analysis using pe view or pe studio it is the strongest and helps a lot
4. Check the time date stamp at image file header it gives us the date of compilation of the virus and it is helpful sometimes it may be designed to always give you the same date and sometimes it will give you **1990s** dates that indicates the **Balkans delfi compiler**
5. Check IMAGE_SECTION_HEADER.text to check for the size of raw data and virtual size with comparing them if there is a **big difference** you would expect it is a **packed malware**
6. Go to SECTION.rdata you will find the IAT IMPORT ADDRESS TABLE it contains the windows apis the malware is running and to check them you can go and see
<https://malapi.io>
7. Check always first bytes of file to know its type **MZ** means Executable
8. Check for libraries of dll used something like **urlmon.dll** which is from OLE32 Extensions for Win32
It is object linking and embedding and it allows different Microsoft Office components to talk with each other. It is commonly used by hackers or **wininet.dll** internet extension for Windows DLL which isn't malicious itself but it is usually used by hackers
9. In PE studio look also at strings as it gets the best guess of what that string is doing

10.

11. If you set a shared folder then make it a folder that you dont care for things in it as if you are analyzing a ransomware

You may lose all that file data cuz of that ransomware if you dont want shared folder you can use network protocol like ftp

Or use a usb that out vm will access

12.

File Identification

Determine the type of file you are examining

Attackers try to disguise files

- Double extensions
- Archives

Packer detection

Main questions to answer in the static analysis phase

Important note even in static analysis phase there are some tools

That needs to execute the malware to collect needed info so always do it on the vm

And note so tools are backdoors and malware themselves so always analyze your tools

They use a double extension as they put an extension that makes it dont look like an executable
While it is really an exec ...

Archives : they try to put their malwares in an archives such as winrar that has its own programming language it makes the archive contains the malware and a script that runs by opening the archive
That will launch the malware

To make sure it is started when system is rebooted

Malware will try to resolve to a well known name if it is connected then it is not a sandbox

Uppercase letters lower case letters numbers plus sign and forward slash is important to see in the file it indicates base64 encoding

Means malware has anti analysis ability

Because xor is 00 means it is not hidden

20 and 27 are to switch case

Those are my knowledge from three different courses :

PMAT-TCM

Malware Analysis Fundamentals-Pluralsight

Malware Analysis Fundamentals-Maharatech

All rights reserved for their content and it's just some notes from a student not me making a course from their content 😊

ENG : Mohamed Ewies

[/https://www.linkedin.com/in/mohamed-ewies-59b89a212](https://www.linkedin.com/in/mohamed-ewies-59b89a212)

Packers

Compress or encrypt executables.

Obfuscates program internals.

May contain anti-analysis features.

Hiding Your Virtual Machine

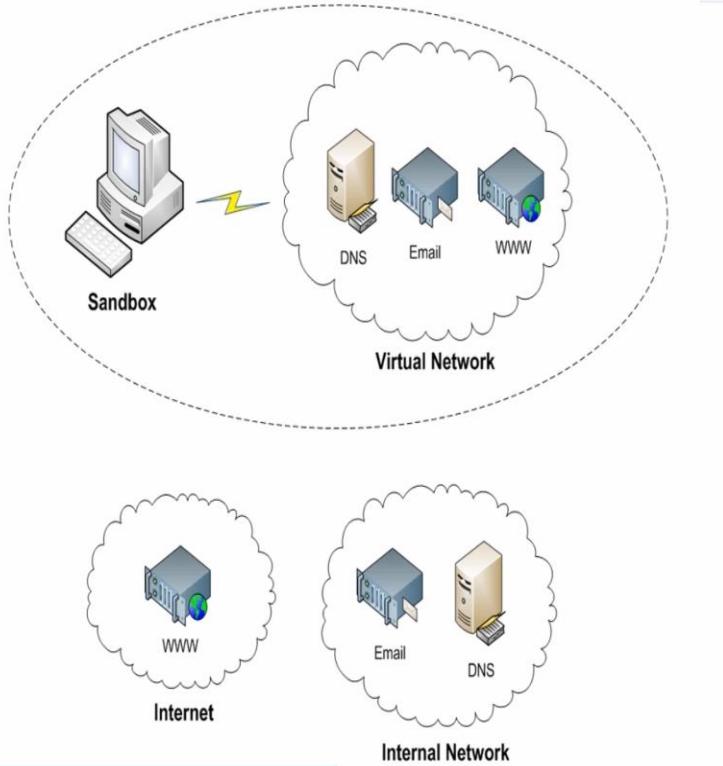

Make the VM look as real as possible

Install common end-user software

Open multiple files and documents

Don't install VM guest tools

Trick the malware into thinking it is online

FakeNet

Tricks malware into thinking it's online

Intercepts on HTTP, SMTP, and more

Logs connections and PCAP

<https://practicalmalwareanalysis.com/fakenet/>

```

FakeNet.cfg - Notepad
File Edit Format View Help
'The format for the options are:
'PacketDumpOptions DumpPackets:XXX Fileprefix:XXXX
'DNSOptions ModifyLocalDNS:XXX
'InvasiveOptions EnableDummyService:XXX RedirectAllTraffic:XX MaxListeners:##
'OutputOptions DumpHTTPPosts:XXX DumpOutput:XXX Fileprefix:XXXX

'These are the default global options
'For the packet and output dump fileprefix
'the fileprefix you specify will be appended with the
'current date and time and the .pcap extension
PacketDumpOptions DumpPackets:Yes Fileprefix:packets
DNSOptions ModifyLocalDNS:Yes
InvasiveOptions EnableDummyService:Yes RedirectAllTraffic:Yes MaxListeners:200
OutputOptions DumpHTTPPosts:No DumpOutput:No Fileprefix:output

Listener lines must start with a listener type from the following options
1) HTTPListener
2) DNSListener
3) RawListener
4) ICMPLISTENER
5) PythonListener
Depending on which type of listener, there must also be a specific number of
options in the appropriate order. This is case sensitive and will not work
without all options specified in the right order in the right case.

```

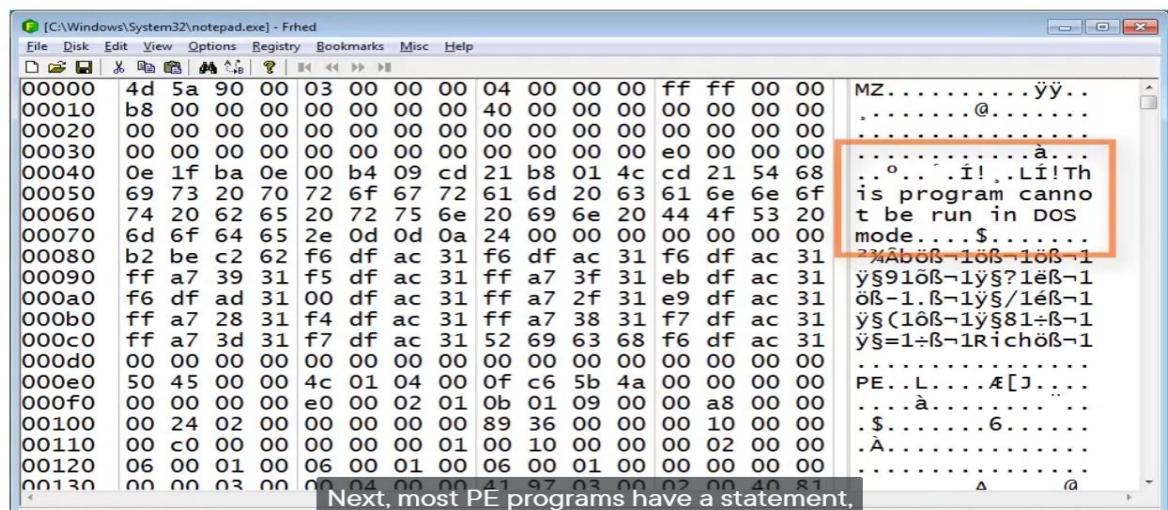

Fakenet by default wont log network connections so you have to set it up and make it LOG
change that to yes and save it make sure you run it as ADMINISTRATOR

All Windows programs will have MZ as their first two bytes.

File Signatures

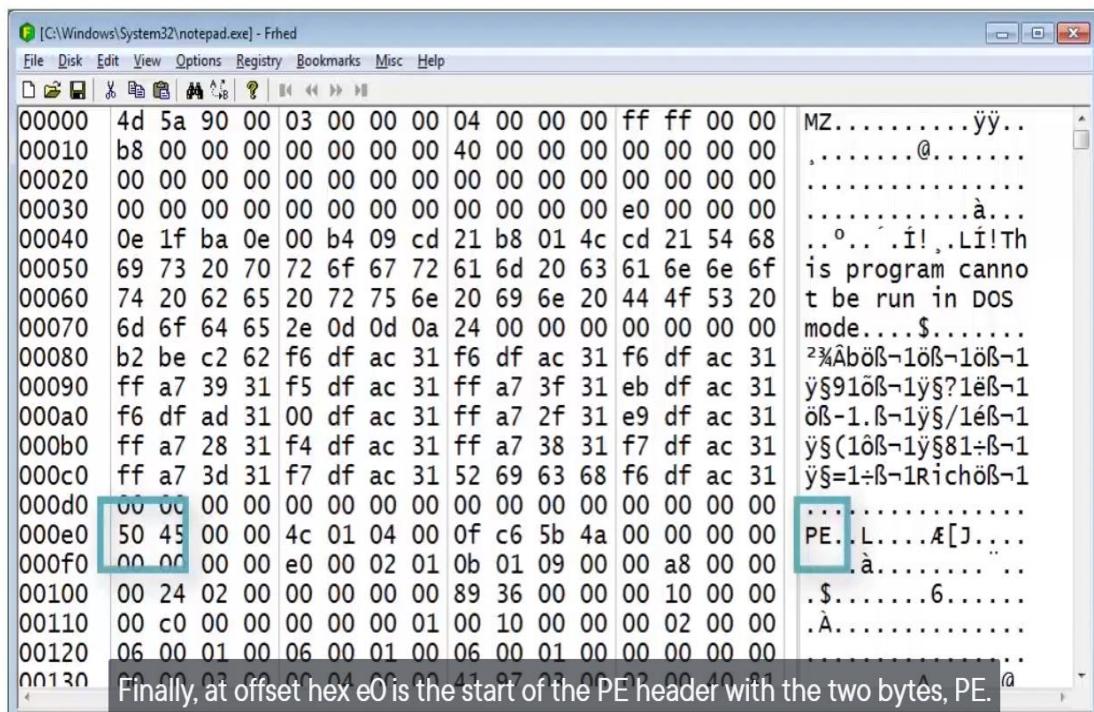

A screenshot of the Frhed hex editor showing the file 'notepad.exe'. The window title is '[C:\Windows\System32\notepad.exe] - Frhed'. The left pane shows the hex dump of the file, and the right pane shows the ASCII representation. At offset 0x0000, the bytes are 4d 5a, which correspond to the ASCII characters 'MZ'. A red box highlights the 'MZ' string.

Next, most PE programs have a statement,

That statement not necessary and some packers might change it or remove it

File Signatures

A screenshot of the Frhed hex editor showing the file 'notepad.exe'. The window title is '[C:\Windows\System32\notepad.exe] - Frhed'. The left pane shows the hex dump of the file, and the right pane shows the ASCII representation. At offset 0x0000, the bytes are 4d 5a, which correspond to the ASCII characters 'MZ'. A blue box highlights the 'MZ' string. At offset 0xe0, the bytes are ff ff, which correspond to the ASCII characters 'ÿÿ'. A blue box highlights the 'ÿÿ' bytes. A text overlay at the bottom right of the window says: 'Finally, at offset hex e0 is the start of the PE header with the two bytes, PE.'

File Signatures You Should Know

Windows Executable “MZ” in bytes 0-1

PDF “%PDF-” followed by
 number within first
 1024 bytes

Old Office Doc 0xDOCF11E0
 (“DOCFILE”)

Zip Archive “PK” in bytes 0-1

File

**Compares file header with known
signatures**

but does not provide much in-depth information on the file you are looking at.

Exeinfo PE

Analyzes Windows PE header information

Packer detection

Gives hints on how to unpack

Embedded strings analysis extracts and examines groups of readable characters from a file.

Types of Strings

ASCII

7-bits long									128 characters								
45	78	70	6C	6F	72	65	72	00	E	x	p	I	o	r	e	r	.

Unicode

8-, 16-, 32-bit characters									Over 128,000 characters								
0045	0078	0070	006C	006F	0072	0065	0072	0000	.E.x.p.I.o.r.e.r..	.E.x.p.I.o.r.e.r..	.E.x.p.I.o.r.e.r..	.E.x.p.I.o.r.e.r..	.E.x.p.I.o.r.e.r..	.E.x.p.I.o.r.e.r..	.E.x.p.I.o.r.e.r..	.E.x.p.I.o.r.e.r..	.E.x.p.I.o.r.e.r..
.	E	.	x	.	p	.	I	.	o	.	r	.	e	.	r	.	.

you need to make sure your tool is extracting both ASCII and Unicode strings.

Strings

Extracts ASCII and Unicode at the same time

Minimum string length: 3

<https://technet.microsoft.com/en-us/sysinternals/strings.aspx>

Options

-n # : Set minimum string length

-o : Print decimal offset of string

BinText

Extracts ASCII and Unicode at the same time

Minimum string length: 5

Watch out for the repeating bug!

<https://www.mcafee.com/us/downloads/free-tools/bintext.aspx>

Packed

String Hiding Tricks

Random Strings

Packers may add random or legitimate looking strings to trick you.

Encrypted Strings

Strings may be encoded or encrypted.

Base64 encoding and XOR encryption.

Base64 Encoding

Converts 3 bytes to 4 ASCII characters

A-Za-z0-9+/- are the default characters used

Strings padded to length of 4 with “=”

All Base64 encoded strings must be of a length divisible by four.

notice how the encoded string changes.

Detecting Base64 Strings

Base64 alphabet

```
ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789+/
```

Random ASCII strings that end in =

```
Q29tbWFuZHMgZnJvbSB0aGUgd2ViIHNlcnZlciBzaG91bGQgcmVzcG9uZCBpbIB0aGUgZmFzaG1vbj
oKCjxIVFRQIEhFQURFUj4KXHJcb1xyXG4KPGNvbW1hbmoQ+IDxhcmd1bwVuHM+Cgp3aGVyZSBcc1xu
XHJcbiBhcmUgdGh1IGNhcnJpYWd1IHJldHVybiwgbGluZSBmZWVkcwoK==
```

but only have the Base64 alphabet characters in them,

Decoding Base64 Strings

```
doskey atob=powershell  
"[Text.Encoding]::UTF8.GetString([convert]::FromBase64String(\"$*\"))"
```

```
C:\>doskey atob=powershell "[Text.Encoding]::UTF8.GetString([convert]::FromBase64String(\"$*\"))"  
C:\>atob SGVsbG8gV29ybGQh  
Hello World!
```

XOR

XOR Truth Table		
Input		Output
0	0	0
0	1	1
1	0	1
1	1	0

$$A \oplus K = C$$

$$C \oplus K = A$$

$$A \oplus O = A$$

$$A \oplus A = O$$

XOR Encoding

E	x	p	I	o	r	e	r	.
45	78	70	6C	6F	72	65	72	00
			\oplus 65	\oplus 65	\oplus 65	\oplus 65	\oplus 65	\oplus 65
20	1D	15	09	OA	17	00	17	65

xorsearch

Searches for XOR encoded version of string

<https://blog.didierstevens.com/programs/xorsearch/>

Strings to Search For
This
http
kernel
Create
www

One string that is not good to search for is www.

```
6.1 C:\Windows\system32\cmd.exe
C:\Users\Tyler\Desktop>xorsearch budget-report.exe This
Found XOR 00 position 004E: This program cannot be run in DOS mode....$  

C:\Users\Tyler\Desktop>xorsearch budget-report.exe Create
Found XOR 00 position 2C418: CreateFile
Found XOR 00 position 2C50C: Create
Found XOR 00 position 3055B: CreateKeyExA
Found XOR 00 position 3063C: CreateDirectoryA
Found XOR 00 position 30650: CreateEventA
Found XOR 00 position 30660: CreateFileA
Found XOR 00 position 3066E: CreateMutexA
Found XOR 00 position 3067E: CreateProcessA
Found XOR 00 position 30690: CreateSemaphoreA
Found XOR 00 position 306A4: CreateThread
Found XOR 00 position 306B4: CreateToolhelp32Snapshot
Found XOR 00 position 30EF2: CreateWindowExA
C:\Users\Tyler\Desktop>
```

so unfortunately we're not finding any hidden strings.

And then 7D is probably some random strings that just happen to be http.

My main goals in malware analysis from a to z is to answer those questions

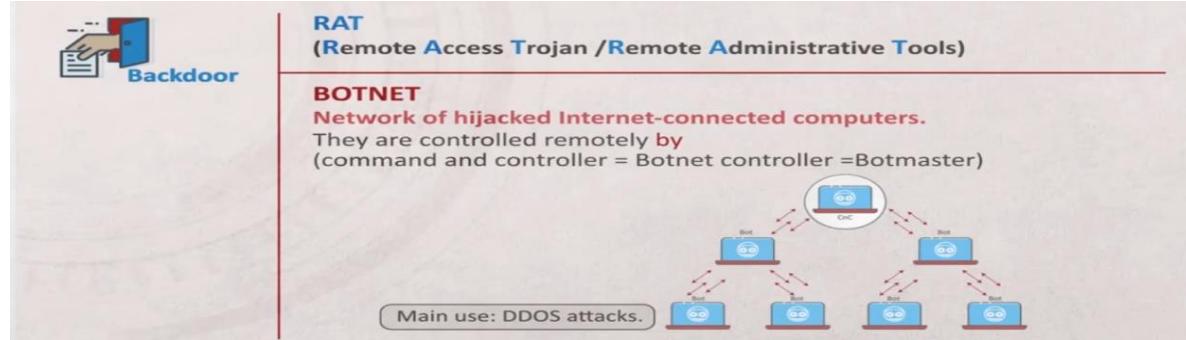

Basic Static Analysis

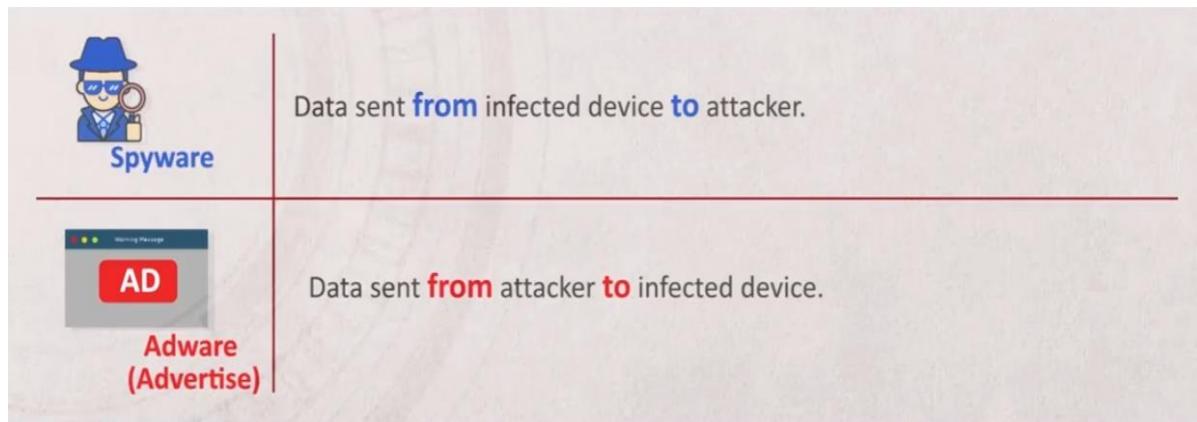

Focus Your Analysis

Monday, 10 October 2022

8:43 PM

 Bootkits	= Boot Capability + Rootkits	
<ul style="list-style-type: none"> ■ Are rootkits in which the first point of control is during the boot process. This allows the malicious program to be executed before the operating system boots. ■ Malicious boot record <u>cannot just be deleted or moved without damaging the computer</u>. 	Runs in Kernel-mode Has more than one component	<ul style="list-style-type: none"> ■ Designed to hide the existence of certain processes from normal methods of detection; in order to enable continued access to a computer. ■ Examples: Stuxnet, Flame.

PUPs (Potentially-Unwanted Programs)

Examples

Toolbars for the browser
Source: Raymond.cc

Add-ons / Extensions for the browser
Source: Bleepingcomputer.com

Desktop programs
that show fake promotions or show the weather
Source: 3-spyware.com

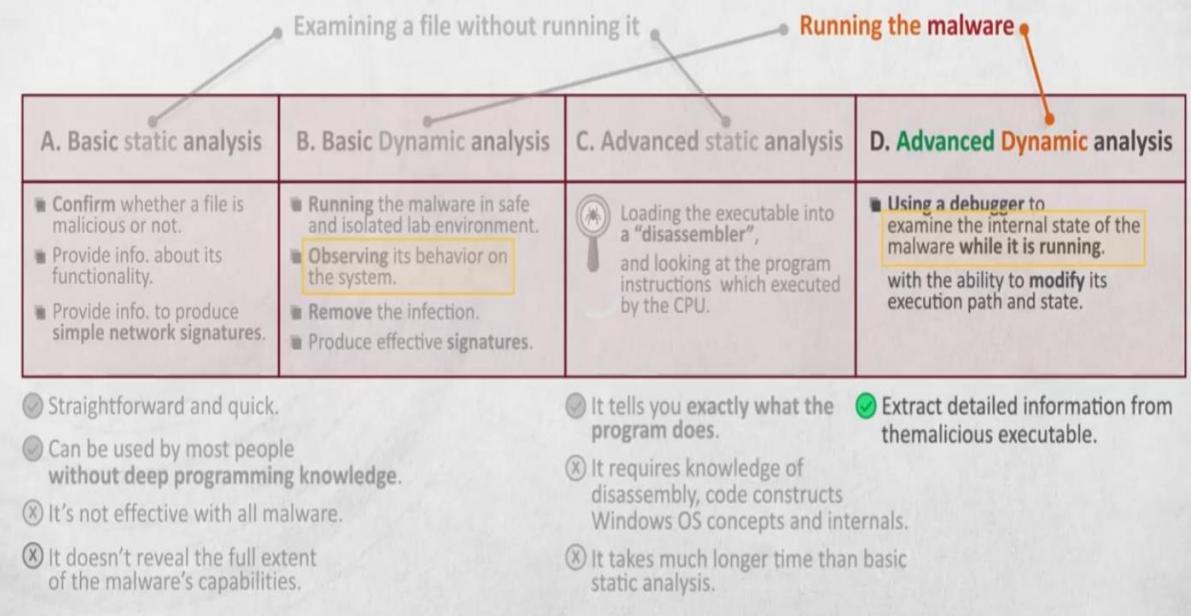

Android apps
that spam you with notifications or ads
Or that show ads in the home screen or in
the file manager
Source: androidcentral.com

Why They're Called PUPs and Not Malware?

- Because mostly the **user agrees** to installing the PUP.
(EULA)
 - The **end user license agreement** informs the user that this additional program is being installed, and **the user accepts it.**

||| Steps of malware analysis

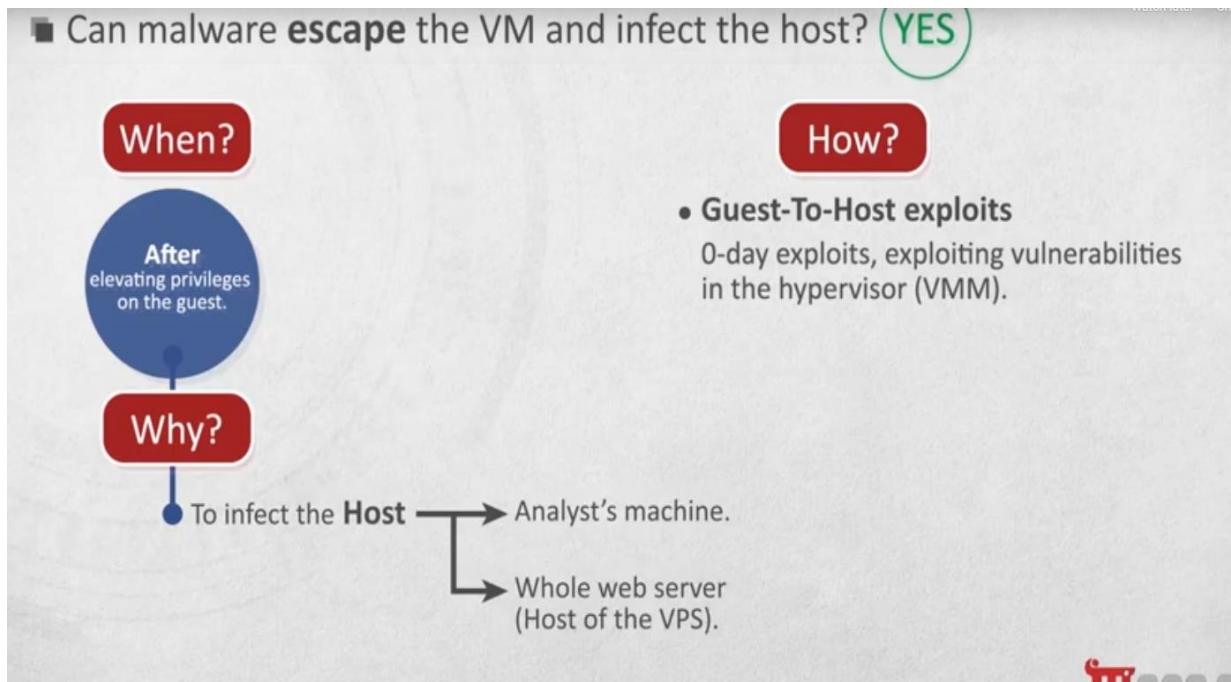

■ Can malware detect it's running inside a VM? YES

How?

By detecting artifacts of the virtualization infrastructure:

- Hypervisor (VMM).
 - Operating system **uptime** is < 1 hour.
 - No mouse movement or user interaction.
- Virtualized hardware components.
 - Disk size is < 60 GB.
 - RAM is < 1 GB.
- Processes and/or Services.
- Files.
 - No files on the "Desktop".
 - No files in "My Documents" or "Downloads" folders.
- Registry.

Examples Guest-To-Host exploits Watch later

■ **Vmware**

- UHC (CVE-**2019**-5518).
- NIC (CVE-**2018**-6973).
- Drag n Drop (CVE-**2017**-4901).

■ **VirtualBox**

- Core graphics framework (CVE-**2018**-2698).

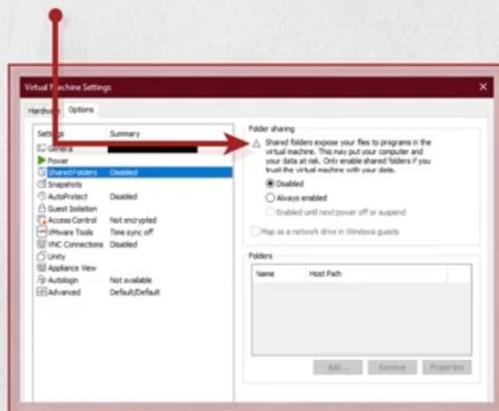

unpatched exploit in oracle virtualbox guest to host escape

Activate Windows
Go to Settings > Update & Security > Windows Update

DON'T FORGET the shared folders

Watch later

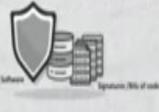

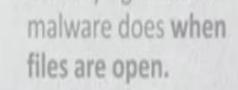

- Ransomware **will encrypt** any folders shared from the host to the guest.
- So be careful when Enabling the “Shared folders” feature.

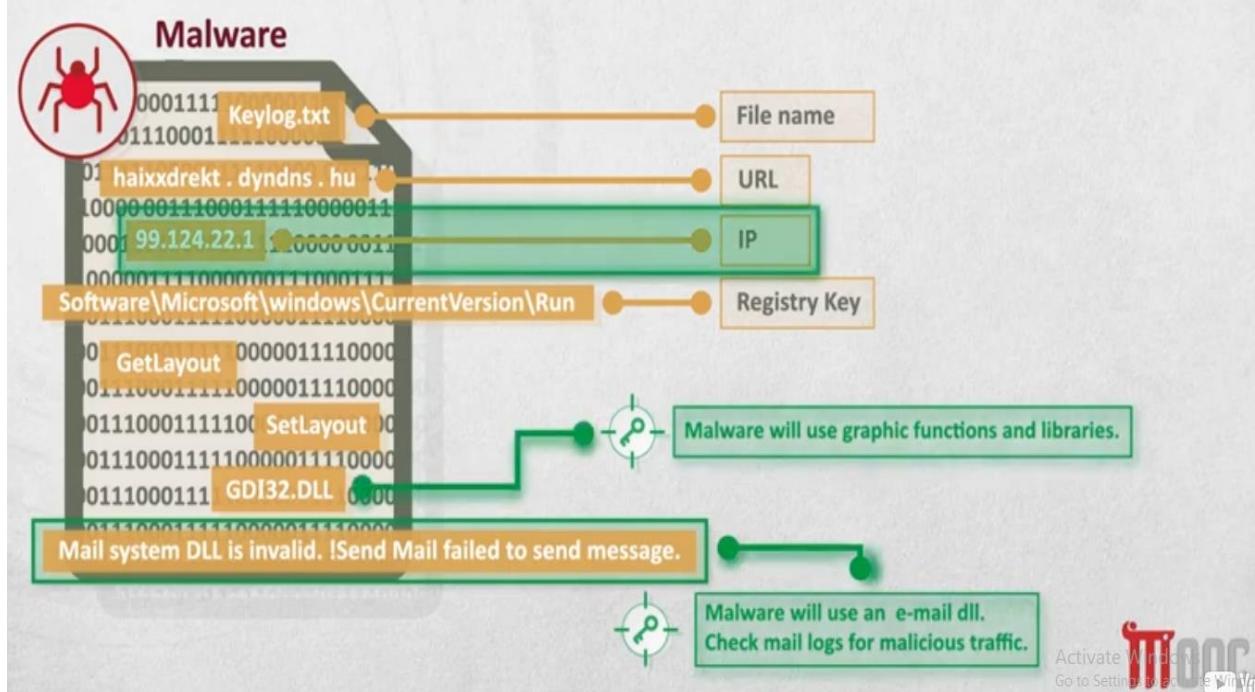

Activate Windows
Go to Settings to activate Windows

A. Basic static analysis

■ Antivirus Scanning

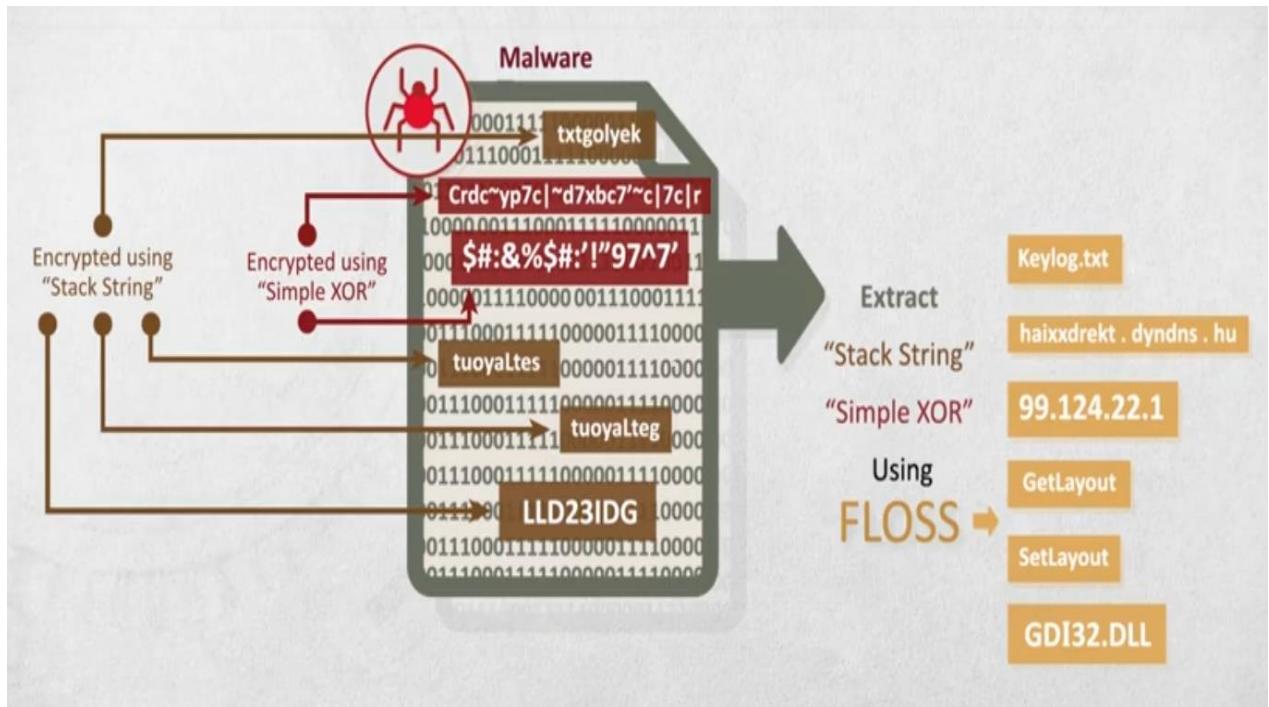

Signatures-based detection	Heuristics-based detection	Behavior-based detection	Machine learning
<ul style="list-style-type: none">• It looks for the specific digital code of a virus.• Disadvantage: It does not detect new threats.  	<ul style="list-style-type: none">• It looks for specific instructions using a rule or weight-based system. 	<ul style="list-style-type: none">• It looks for software attempting to perform malicious functions.• Disadvantage: Identifying what the malware does when files are open. 	<ul style="list-style-type: none">• Analyze the code of applications and decide based on its understanding of malicious and benign programs.

Strings analysis

ASCII American Standard Code for Information Interchange.	UNICODE Universal character set.
Uses 7 bits to represent a character.	Uses 8 bit, 16 bit, 32 bit UTF-8 , UTF-16 , UTF-32
Requires less space .	Requires more space .

	Encoding	Bits
A	ASCII	01000010
A	UTF-8	01000010
A	UTF-16	00000000 01000010

Basic structure of a PE file format

DOS MZ header

DOS stub

PE header

Section

Activate Windows
Go to Settings > Activate Window

Address of entry point in optional header is important and in most of reputable companies it is .text and that is the address at which the code starts and other important header size of image it is the size of malware when it is unpacked and running

Contains all user interface components (button, scroll bar, control and respond user actions).

Contains display and manipulate graphics function.

Contains high and low level networking functions.

Provides access to advanced core windows components (service manager and registry).

User32 . dll

Gdi32 . dll

WSock32 . dll

Ws2_32 . dll

Wininet . dll

Advapi32 . dll

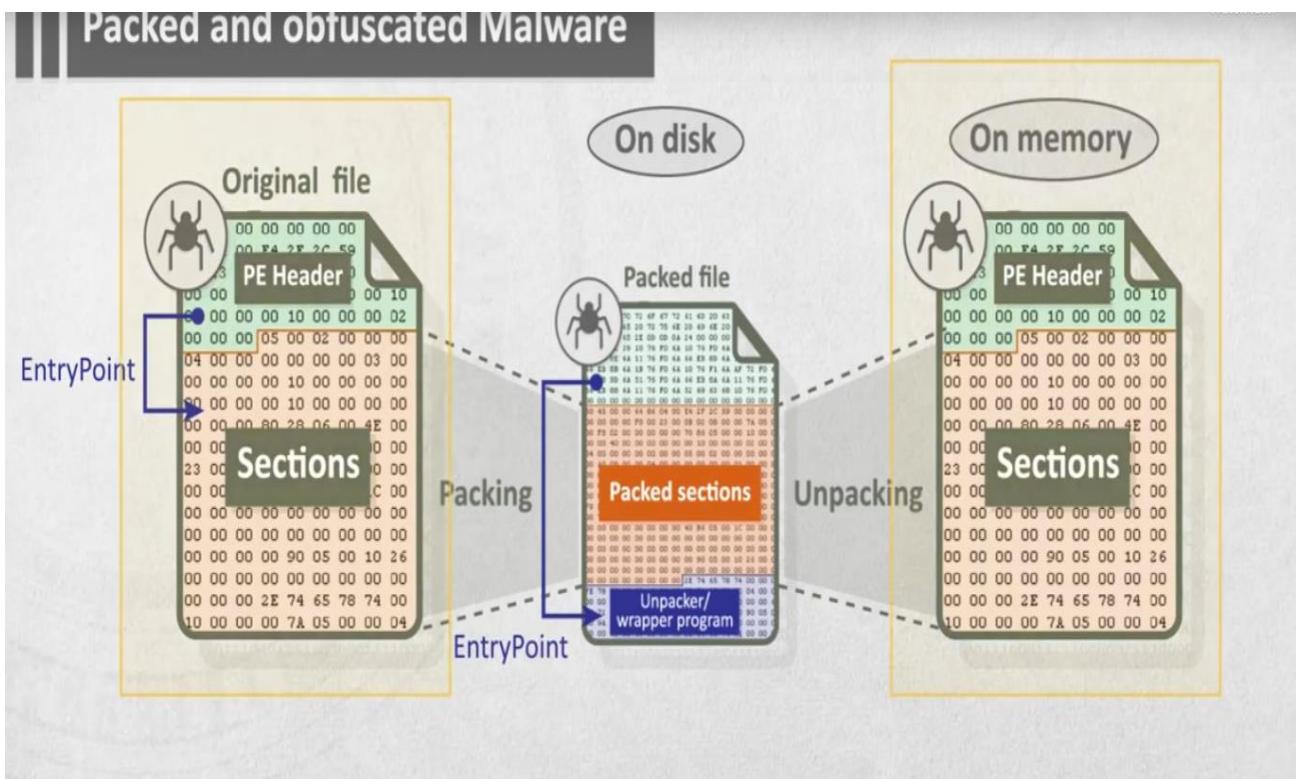

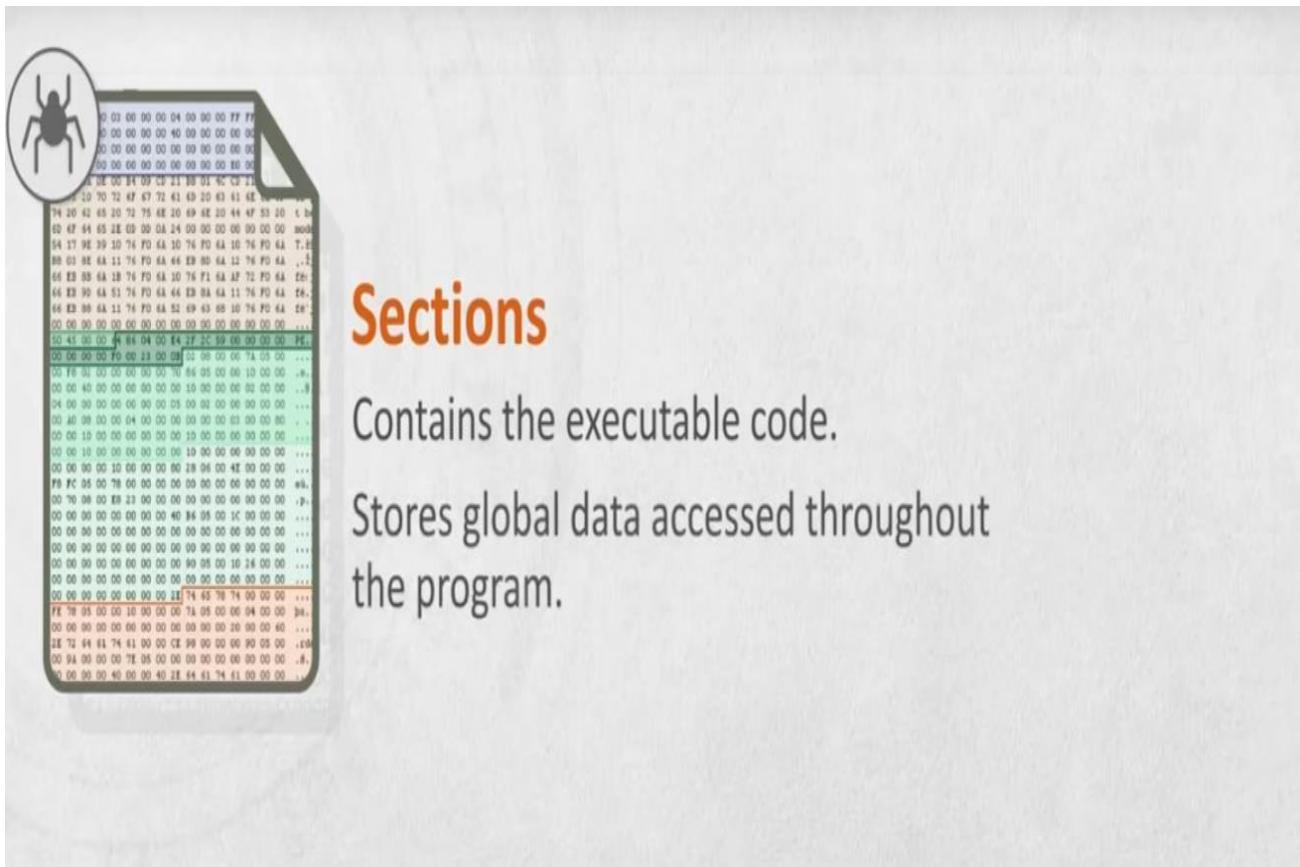

Common imported Functions by malware

Naming Conventions.

- A ASCII strings version.
- W Wide character strings version.
- Ex Updated function.

Kernel32.dll	User32.dll	User32.dll (continued)
CreateDirectoryW	BeginReferWindowPos	ShowWindow
CreateFileW	CallNextHookEx	ToUnicodeEx
CreateThread	CreateDialogParamW	TrackPopupMenu
DeleteFileW	CreateWindowExW	TrackPopupMenuEx
ExitProcess	DefWindowProcW	TranslateMessage
FindClose	DialogBoxParamW	UnhookWindowsHookEx
FindFirstFileW	EndDialog	UnregisterClassW
FindNextFileW	GetMessageW	UnregisterHotKey
GetCommandLineW	GetSystemMetrics	
GetCurrentProcess	GetWindowLongW	
GetCurrentThread	GetWindowRect	
GetFileSize	GetWindowTextW	
GetModuleHandleW	InvalidateRect	
GetProcessHeap	IsOlgButtonChecked	
GetShortPathNameW	IsWindowEnabled	
HeapAlloc	LoadCursorW	
HeapFree	LoadIconW	
IsDebuggerPresent	LoadMenuW	
MapViewOfFile	MapVirtualKeyW	
OpenProcess	MapWindowPoints	
ReadFile	MessageBoxW	
SetFilePointer	RegisterClassExW	
WriteFile	RegisterHotKey	
	SendMessageA	
	SetClipboardData	
	SetDlgItemTextW	
	SetWindowTextW	
	SetWindowsHookExW	
		RegCloseKey
		RegDeleteValueW
		RegOpenCurrentUser
		RegOpenKeyExW
		RegQueryValueExW
		RegSetValueExW

Packed and Obfuscated Malware Tools to identify packers

■ PEID

- “Normal Mode” scans the PE files at their Entry Point for all documented signatures. This is what all other identifiers also do
- “Deep Mode” scans the PE file's Entry Point containing section for all the documented signatures. This ensures detection of around 80% of modified and scrambled files.
- “Hardcore Mode” does a complete scan of the entire PE file for the documented signatures. You should use this mode as a last option as the small signatures often tend to occur a lot in many files and so erroneous outputs may result.

Packed and Obfuscated Malware Tools to identify packers

■ PEID

■ Exeinfo PE

■ DIE (Detect It Easy)

Entropy

Entropy

Offset: 0 Size: 1671168

Entropy(bits/byte): 7.90769 98% packed

Curve Histogram Bytes

PE header["2.60367"] -
Section0["UPX0"]("0")
Section1["UPX1"]("7.9158")
Section2["zrc"]("6.08792")

Offset: Size:

100% OK

Checking the differences between the packed and unpacked versions.

Detecting if the executable is packed and the type of packer:

- PEID
- Exeinfo PE
- ■ DIE (Detect It Easy)

■ Can we analyze the malware packed using **unknown packers** ?

Automatic unpacker may unpack **part of** the executable file .
